

7610.1430 CRITERIA FOR FORECAST.

For the last calendar year, historical data must be supplied. If recorded figures are not available, estimates must be used and be identified as estimates. For each other reporting year, the forecast must be made using the supplier's best estimates of the amount of each petroleum product that will be supplied. These estimates must be based on the factors that the supplier considers most likely to occur in its Minnesota service area. The data for each reporting year must be calculated by applying these factors to the data for the last calendar year for which actual data required in part 7610.1410 is available.
