

1 Pollution Control Agency

2

3 Adopted Permanent Rules Relating to Underground Storage Tanks

4

5 Rules as Adopted

6

PROGRAM SCOPE AND INTERIM STANDARDS

7 7150.0010 APPLICABILITY.

8

Subpart 1. **Scope.** The requirements of this chapter apply

9

to all owners and operators of an underground storage tank

10

system as defined in part 7150.0030, except as otherwise

11

provided in this subpart and subparts 2 and 3. Any underground

12

storage tank system listed in subpart 3 must meet the

13

requirements of part 7150.0020.

14

Subp. 2. **Exclusions.** The following underground storage

15

tank systems are excluded from the requirements of this chapter:

16

A. an underground storage tank system holding

17

hazardous wastes listed or identified under chapter 7045 or Code

18

of Federal Regulations, title 40, part 261, or a mixture of such

19

hazardous waste and other regulated substances;

20

B. a wastewater treatment tank system that is part of

21

a wastewater treatment facility regulated under United States

22

Code, title 33, section 1317 or 1342;

23

C. equipment or machinery that contains regulated

24

substances for operational purposes such as hydraulic lift tanks

25

and electrical equipment tanks;

26

D. an underground storage tank system with a capacity

27

of 110 gallons or less;

28

E. an underground storage tank system that contains a

29

de minimus concentration of regulated substances;

30

F. an emergency spill or overflow containment

31

underground storage tank system that is expeditiously emptied

32

after use;

33

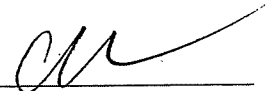

G. a farm or residential tank of 1,100 gallons or

34

less capacity used for storing motor fuel for noncommercial

35

purposes;

1 H. a tank of 1,100 gallons or less capacity used  
2 exclusively for storing heating oil for consumptive use on the  
3 premises where stored;

4 I. a septic tank;

5 J. a pipeline facility, including gathering lines,  
6 regulated under United States Code, title 49, chapter 24 or 29;

7 K. a surface impoundment, pit, pond, or lagoon;

8 L. a storm water or wastewater collection system;

9 M. a flow-through process tank; and

10 N. a storage tank situated in an underground area  
11 such as a basement, cellar, mineworking, drift, shaft, or tunnel  
12 if the storage tank is located upon or above the surface of the  
13 floor.

14 Subp. 3. **Deferrals.** Parts 7150.0100 to 7150.0440 do not  
15 apply to any of the following types of underground storage tank  
16 systems:

17 A. wastewater treatment tank systems;

18 B. underground storage tank systems containing  
19 radioactive material that are regulated under the Atomic Energy  
20 Act of 1954, United States Code, title 42, sections 2011 to  
21 2296;

22 C. an underground storage tank system that is part of  
23 an emergency generator system at nuclear power generation  
24 facilities regulated by the Nuclear Regulatory Commission under  
25 Code of Federal Regulations, title 10, part 50, Appendix A;

26 D. airport hydrant fuel distribution systems; and

27 E. underground storage tank systems with  
28 field-constructed tanks.

29 Subp. 4. **Release detection deferrals.** Parts 7150.0300 to  
30 7150.0350 do not apply to an underground storage tank system  
31 that stores fuel solely for use by emergency power generators.

32 Subp. 5. **Heating oil underground storage tank deferrals.**  
33 Parts 7150.0100 to 7150.0440, except 7150.0120, subparts 2 and  
34 6, do not apply to an underground storage tank system of over  
35 1,100 gallons capacity used exclusively for storing heating oil  
36 for consumptive use on the premises where stored.

1 7150.0020 INTERIM STANDARDS FOR DEFERRED UNDERGROUND STORAGE  
2 TANK SYSTEMS.

3 Subpart 1. **Interim standards.** No person may install an  
4 underground storage tank system listed in part 7150.0010,  
5 subparts 3 to 5, for the purpose of storing regulated substances  
6 unless the underground storage tank system, whether of single-  
7 or double-wall construction:

8 A. is installed according to requirements of the  
9 American Petroleum Institute Bulletin 1615 to the extent  
10 applicable, and all manufacturer's recommendations;

11 B. will prevent releases due to corrosion or  
12 structural failure for the operational life of the underground  
13 storage tank system;

14 C. is cathodically protected against corrosion,  
15 constructed of noncorrodible material, steel clad with a  
16 noncorrodible material, or designed in a manner to prevent the  
17 release or threatened release of any stored substance; and

18 D. is constructed or lined with material that is  
19 compatible with the stored substance.

20 Subp. 2. **Systems without corrosion protection.**

21 Notwithstanding subpart 1, an underground storage tank system  
22 without corrosion protection may be installed at a site that is  
23 determined by a corrosion expert not to be corrosive enough to  
24 cause it to have a release due to corrosion during its operating  
25 life. Owners and operators must maintain records that  
26 demonstrate compliance with the requirements of this subpart for  
27 the remaining life of the tank. The determination required by  
28 this subpart must be in accordance with the National Association  
29 of Corrosion Engineers, Standard RP-02-85.

30 7150.0030 DEFINITIONS.

31 Subpart 1. **Scope.** For the purposes of this chapter, the  
32 following terms and abbreviations have the meanings given them.  
33 Terms that are not specifically defined have the meanings given  
34 them in Minnesota Statutes, sections 115.01, 115C.02, and 116.46.

35 Subp. 2. ~~2. Aboveground-release.~~ **"Aboveground-release"** means

1 a-release-to-the-surface-of-the-land-or-to-surface-water,  
2 including, but not limited to, releases from the aboveground  
3 part of an underground storage tank system and aboveground  
4 releases associated with overfills and transfer operations as  
5 the regulated substance moves to or from an underground storage  
6 tank system.

7 Subp. 3: 2. Agency. "Agency" means the Minnesota  
8 Pollution Control Agency.

9 Subp. 4: 3. Appurtenances. "Appurtenances" means devices  
10 such as piping, fittings, flanges, valves, and pumps used to  
11 distribute, meter, or control the flow of regulated substances  
12 to or from an underground storage tank.

13 ~~Subp. 5: 4. Belowground release. "Belowground release" means~~  
14 ~~a release to the subsurface of the land and to groundwater,~~  
15 ~~including, but not limited to, releases from the belowground~~  
16 ~~parts of an underground storage tank system and belowground~~  
17 ~~releases associated with overfills and transfer operations as~~  
18 ~~the regulated substance moves to or from an underground storage~~  
19 ~~tank.~~

20 Subp. 6: 4. Beneath the surface of the ground. "Beneath  
21 the surface of the ground" means beneath the ground surface or  
22 otherwise covered with earthen materials.

23 Subp. 7: 5. Cathodic protection. "Cathodic protection"  
24 means using a technique to prevent corrosion of a metal surface  
25 by making that surface the cathode of an electrochemical cell.  
26 For example, a tank system can be cathodically protected through  
27 the application of either galvanic anodes or impressed current.

28 Subp. 8: 6. Cathodic protection tester. "Cathodic  
29 protection tester" means a person who can demonstrate an  
30 understanding of the principles and measurements of all common  
31 types of cathodic protection systems as applied to buried or  
32 submerged metal piping and tank systems. At a minimum, such  
33 persons must have education and experience in soil resistivity,  
34 stray current, structure-to-soil potential, and component  
35 electrical isolation measurements of buried metal piping and  
36 tank systems.

1 Subp. ~~9~~ 7. **Change in service.** "Change in service" means  
2 a permanent removal from service or a change in the reported  
3 uses, contents, or ownership of an underground storage tank  
4 under Minnesota Statutes, section 116.48, subdivision 3, or an  
5 upgrade under this chapter.

6 Subp. ~~10~~ 8. **Closure or removal.** "Closure" or "removal"  
7 means permanently taking an underground storage tank out of  
8 service by either closing it in place, removing it from the  
9 ground, or converting it to store a nonregulated substance as  
10 required by this chapter.

11 Subp. ~~11~~ 9. **Commissioner.** "Commissioner" means the  
12 commissioner of the Minnesota Pollution Control Agency.

13 Subp. ~~12~~ 10. **Compatible.** "Compatible" means the ability  
14 of two or more substances to maintain their respective physical  
15 and chemical properties upon contact with one another for the  
16 design life of the tank system under conditions likely to be  
17 encountered in the underground storage tank.

18 Subp. ~~13~~ 11. **Connected piping.** "Connected piping" means  
19 underground piping including valves, elbows, joints, flanges,  
20 and flexible connectors attached to a tank system through which  
21 regulated substances flow. For the purpose of determining how  
22 much piping is connected to an individual underground storage  
23 tank system, the piping that joins two underground storage tank  
24 systems should be allocated equally between them.

25 Subp. ~~14~~ 12. **Consumptive use.** "Consumptive use," with  
26 respect to heating oil, means consumed on the premises.

27 Subp. ~~15~~ 13. **Corrosion expert.** "Corrosion expert" means  
28 a person who, by reason of thorough knowledge of the physical  
29 sciences and the principles of engineering and mathematics  
30 acquired by a professional education and related practical  
31 experience, is qualified to engage in the practice of corrosion  
32 control on buried or submerged metal piping systems and metal  
33 tanks. The person must be accredited or certified as being  
34 qualified by the National Association of Corrosion Engineers or  
35 be a registered professional engineer who has certification or  
36 licensing that includes education and experience in corrosion

1 control of buried or submerged metal piping systems and metal  
2 tanks.

3 Subp. ~~16-~~ 14. **Dielectric material.** "Dielectric material"  
4 means a material that does not conduct direct electrical  
5 current. Dielectric coatings are used to electrically isolate  
6 underground storage tank systems from the surrounding soils.  
7 Dielectric bushings are used to electrically isolate parts of  
8 the underground storage tank system, for example, tank from  
9 piping.

10 Subp. ~~17-~~ 15. **Electrical equipment.** "Electrical equipment"  
11 means underground equipment that contains dielectric fluid that  
12 is necessary for the operation of equipment such as transformers  
13 and buried electrical cable.

14 Subp. ~~18-~~ 16. **Excavation zone.** "Excavation zone" means  
15 the volume containing the tank system and backfill material  
16 bounded by the ground surface, walls, and floor of the pit and  
17 trenches into which the underground storage tank system is  
18 placed at the time of installation.

19 Subp. ~~19-~~ 17. **Existing tank system.** "Existing tank system"  
20 means a tank system used to contain an accumulation of regulated  
21 substances or for which installation began on or before December  
22 22, 1988. However, a tank system containing hazardous materials  
23 that is not regulated under Code of Federal Regulations, title  
24 40, part 280, is considered an existing tank system if  
25 installation began on or before (insert 90 days after date of  
26 adoption). Installation is considered to have begun if:

27 A. the owner or operator has obtained all federal,  
28 state, and local approvals or permits necessary to begin  
29 physical construction of the site or installation of the tank  
30 system; and

31 B. either a continuous on-site physical construction  
32 or installation program has begun, or the owner or operator has  
33 entered into contractual obligations, that cannot be canceled or  
34 modified without substantial loss, for physical construction at  
35 the site or installation of the tank system to be completed  
36 within a reasonable time.

1 Subp. ~~20~~ 18. **Farm tank.** "Farm tank" means a tank located  
 2 on a tract of land devoted to the production of crops, raising  
 3 animals, including fish, range land, nurseries with growing  
 4 operations, and associated residences and improvements. A farm  
 5 tank must be located on the farm property.

6 Subp. ~~21~~ 19. **Flow-through process tank.** "Flow-through  
 7 process tank" means a tank that forms an integral part of a  
 8 production process through which there is a steady, variable,  
 9 recurring, or intermittent flow of materials during the  
 10 operation of the process. Flow-through process tanks do not  
 11 include tanks used for the storage of materials prior to their  
 12 introduction into the production process or for the storage of  
 13 finished products or by-products from the production process.

14 Subp. ~~22~~ 20. **Free product.** "Free product" means a  
 15 regulated substance that is present as a nonaqueous phase  
 16 liquid, for example, liquid not dissolved in water.

17 Subp. ~~23~~ 21. **Gathering lines.** "Gathering lines" means a  
 18 pipeline, equipment, facility, or building used in the  
 19 transportation of oil or gas during oil or gas production or  
 20 gathering operations.

21 Subp. ~~24~~ 22. **Hazardous material.** "Hazardous material"  
 22 means:

23 A. a substance listed in Code of Federal Regulations,  
 24 title 49, section 172.101, including petroleum under subpart ~~38~~  
 25 36, item C, but not including:

26 (1) a hazardous waste listed or identified under  
 27 chapter 7045 or Code of Federal Regulations, title 40, part 261;

28 (2) petroleum under subpart ~~38~~ 36, item A, B, or  
 29 D; or

30 (3) a substance that is not liquid at a  
 31 temperature of 60 degrees Fahrenheit and pressure of 14.7 pounds  
 32 per square inch absolute; or

33 B. any mixture of substances identified in item A and  
 34 petroleum, unless the amount of the substance identified in item  
 35 A is de minimus.

36 Substances identified in items A and B which also meet the

1 definition of petroleum are considered hazardous materials.

2 Subp. ~~25~~ 23. **Hazardous material underground storage tank**  
3 **system.** "Hazardous material underground storage tank system"  
4 means an underground storage tank system that is used to contain  
5 a hazardous material.

6 Subp. ~~26~~ 24. **Heating oil.** "Heating oil" means petroleum  
7 that is Nos. 1, 2, and 4 light, No. 4 heavy, No. 5 light, No. 5  
8 heavy, and No. 6 technical grades of fuel oil; other residual  
9 fuel oils, including Navy Special Fuel Oil and Bunker C; and  
10 other fuels when used as substitutes for one of these fuel oils.  
11 Heating oil is typically used in the operation of heating  
12 equipment, boilers, or furnaces.

13 Subp. ~~27~~ 25. **Hydraulic lift tank.** "Hydraulic lift tank"  
14 means a tank holding hydraulic fluid for a closed-loop  
15 mechanical system that uses compressed air or hydraulic fluid to  
16 operate lifts, elevators, and other similar devices.

17 Subp. ~~28~~ 26. **Maintenance.** "Maintenance" means the normal  
18 operational upkeep to prevent an underground storage tank system  
19 from releasing a regulated substance.

20 Subp. ~~29~~ 27. **Motor fuel.** "Motor fuel" means petroleum or  
21 a petroleum-based substance that is motor gasoline, aviation  
22 gasoline, No. 1 or 2 diesel fuel, or any grade of gasohol, and  
23 is typically used in the operation of a motor engine.

24 Subp. ~~30~~ 28. **New tank system.** "New tank system" means a  
25 tank system that is or will be used to contain an accumulation  
26 of regulated substances and which is not an existing tank system  
27 as defined in subpart ~~19~~ 17.

28 Subp. ~~31~~ 29. **Noncommercial purposes.** "Noncommercial  
29 purposes," with respect to motor fuel, means not for resale.

30 Subp. ~~32~~ 30. **On the premises where stored.** "On the  
31 premises where stored," with respect to heating oil, means  
32 underground storage tank systems located on the same property  
33 where the stored heating oil is used.

34 Subp. ~~33~~ 31. **Operational life.** "Operational life" means  
35 the period beginning when installation of the tank system has  
36 begun until the time the tank system is properly closed under

1 parts 7150.0400 to 7150.0440.

2 Subp. ~~34~~ 32. **Operator.** "Operator" means a person in  
3 control of or having responsibility for the daily operation of  
4 the underground storage tank system or a person who was in  
5 control of or had responsibility for the daily operation of the  
6 tank immediately before discontinuation of its use.

7 Operator also means a person who is responsible under  
8 Minnesota Statutes, section 115C.021, for a release from an  
9 underground storage tank containing petroleum, or a person who  
10 is responsible under Minnesota Statutes, section 115B.03, for a  
11 release from an underground storage tank containing a hazardous  
12 material. Operator does not include a person who operates a  
13 tank if the tank is not regulated by this chapter.

14 Subp. ~~35~~ 33. **Overfill release.** "Overfill release" means  
15 a release occurring when a tank is filled beyond its capacity,  
16 resulting in a discharge of the regulated substance to the  
17 environment.

18 Subp. ~~36~~ 34. **Owner.** "Owner" means a person who holds  
19 title to, controls or possesses an interest in an underground  
20 storage tank, and a person who held title to, controlled, or  
21 possessed an interest in the tank immediately before  
22 discontinuation of its use.

23 Owner also means a person who is responsible under  
24 Minnesota Statutes, section 115C.021, for a release from an  
25 underground storage tank containing petroleum, or a person who  
26 is responsible under Minnesota Statutes, section 115B.03, for a  
27 release from an underground storage tank containing a hazardous  
28 material.

29 Owner does not include a person who owns a tank if the tank  
30 is not regulated by this chapter and does not include a person  
31 who holds an interest in a tank solely for financial security,  
32 unless through foreclosure or other related actions the holder  
33 of a security interest has taken possession of the tank.

34 Subp. ~~37~~ 35. **Person.** "Person" means an individual,  
35 partnership, association, public or private corporation, or  
36 other legal entity, including the United States government, an

1 interstate commission or other body, the state, or any agency,  
2 board, bureau, office, department, or political subdivision of  
3 the state, but does not include the Minnesota Pollution Control  
4 Agency.

5 Subp. ~~38~~ 36. **Petroleum.** "Petroleum" means one of the  
6 following substances:

7 A. gasoline and fuel oil as defined in Minnesota  
8 Statutes, section 296.01, subdivisions 3 and 4;

9 B. crude oil or a fraction of crude oil that is  
10 liquid at a temperature of 60 degrees Fahrenheit and pressure of  
11 14.7 pounds per square inch absolute;

12 C. constituents of gasoline and fuel oil under item A  
13 and constituents of crude oil under item B; or

14 D. petroleum-based substances that are comprised of a  
15 complex blend of hydrocarbons derived from crude oil through  
16 processes of separation, conversion, upgrading, and finishing,  
17 such as motor fuels, jet fuels, distillate fuel oils, residual  
18 fuel oils, lubricants, and used oils.

19 Subp. ~~39~~ 37. **Petroleum underground storage tank system.**  
20 "Petroleum underground storage tank system" means an underground  
21 storage tank system that is used to contain petroleum or a  
22 mixture of petroleum with de minimus quantities of hazardous  
23 materials.

24 Subp. ~~40~~ 38. **Pipe or piping.** "Pipe" or "piping" means a  
25 hollow cylinder or tubular conduit for conveying a regulated  
26 substance from one point to another within an underground  
27 storage tank system.

28 Subp. ~~41~~ 39. **Pipeline facilities.** "Pipeline facilities,"  
29 including gathering lines, means new and existing pipe  
30 rights-of-way and any associated equipment, facilities, or  
31 buildings.

32 Subp. ~~42~~ 40. **Regulated substance.** "Regulated substance"  
33 means a hazardous material or petroleum.

34 Subp. ~~43~~ 41. **Release.** "Release" means a spilling,  
35 leaking, emitting, discharging, escaping, leaching, or disposing  
36 from an underground storage tank into the environment including

1 spills associated with overfills and transfer operations as the  
2 regulated substance moves to or from an underground storage tank  
3 system. "Release" does not include discharges or designed  
4 venting allowed under agency rules.

5 Subp. ~~44~~ 42. **Release detection.** "Release detection"  
6 means determining whether a release of a regulated substance has  
7 occurred from the underground storage tank system into the  
8 environment or into the interstitial space between the  
9 underground storage tank system and its secondary barrier or  
10 secondary containment around it.

11 Subp. ~~45~~ 43. **Repair.** "Repair" means the correction,  
12 restoration, modification, or upgrading of a tank system,  
13 including, but not limited to, the addition of cathodic  
14 protection systems, the replacement of piping, valves, fill  
15 pipes or vents, the lining of a tank through the application of  
16 materials such as epoxy resins, or any other similar activities  
17 that may affect the integrity of the tank system.

18 Subp. ~~46~~ 44. **Residential tank.** "Residential tank" means  
19 a tank located on property used primarily for dwelling purposes.

20 Subp. ~~47~~ 45. **Septic tank.** "Septic tank" means a  
21 watertight, covered receptacle designed to receive or process  
22 through liquid separation or biological digestion, the sewage  
23 discharged from a building sewer. The effluent from the  
24 receptacle is distributed for disposal through the soil and  
25 settled solids and scum from the tank are pumped out  
26 periodically and hauled to a treatment facility.

27 Subp. ~~48~~ 46. **Storm water or wastewater collection system.**  
28 "Storm water or wastewater collection system" means piping,  
29 pumps, conduits, and any other equipment necessary to collect  
30 and transport the flow of surface water run-off resulting from  
31 precipitation, or domestic, commercial, or industrial wastewater  
32 to and from retention areas or areas where treatment is  
33 designated to occur. The collection of storm water and  
34 wastewater does not include treatment, except where incidental  
35 to conveyance.

36 Subp. ~~49~~ 47. **Surface impoundment.** "Surface impoundment"

1 means a natural topographic depression, man-made excavation, or  
2 diked area formed primarily of earthen materials, although it  
3 may be lined with man-made materials, that is not an injection  
4 well.

5 Subp. ~~50~~ 48. **Tank.** "Tank" is a stationary device  
6 designed to contain an accumulation of regulated substances and  
7 constructed of nonearthen materials, such as concrete, steel,  
8 and plastic, that provide structural support.

9 Subp. ~~51~~ 49. **Tank system.** "Tank system" has the same  
10 meaning as underground storage tank and underground storage tank  
11 system.

12 Subp. ~~52~~ 50. **Underground area.** "Underground area" means  
13 an underground room such as a basement, cellar, shaft, or vault  
14 providing enough space for physical inspection of the exterior  
15 of the tank situated on or above the surface of the floor.

16 ~~Subp. ~~53~~ -- **Underground release** -- "Underground release"~~  
17 ~~means a belowground release.~~

18 Subp. ~~54~~ 51. **Underground storage tank or underground**  
19 **storage tank system.** "Underground storage tank" or "underground  
20 storage tank system" means any one or combination of containers  
21 including tanks, vessels, enclosures, or structures and  
22 underground appurtenances connected to them that is used to  
23 contain or dispense an accumulation of regulated substances, and  
24 the volume of which, including the volume of underground pipes  
25 connected to them, is ten percent or more beneath the surface of  
26 the ground. This term does not include any tank or pipes  
27 connected to a tank described in part 7150.0010, subpart 2.

28 Subp. ~~55~~ 52. **Upgrade.** "Upgrade" means the addition or  
29 retrofit of systems such as cathodic protection, lining, piping,  
30 or spill and overfill controls to improve the ability of an  
31 underground storage tank system to prevent the release of a  
32 regulated substance.

33 Subp. ~~56~~ 53. **Wastewater treatment tank.** "Wastewater  
34 treatment tank" means a tank that is designed to receive and  
35 treat an influent wastewater through physical, chemical, or  
36 biological methods.

1 UNDERGROUND STORAGE TANK SYSTEMS  
2 DESIGN, CONSTRUCTION, INSTALLATION, AND NOTIFICATION

3 7150.0100 PERFORMANCE STANDARDS FOR NEW UNDERGROUND STORAGE TANK  
4 SYSTEMS.

5 Subpart 1. **Purpose.** To prevent releases due to structural  
6 failure, corrosion, or spills and overfills for as long as the  
7 underground storage tank system is used to store regulated  
8 substances, all owners and operators of new underground storage  
9 tank systems must meet the requirements in subparts 2 to 8.

10 Subp. 2. **Tanks.** Each tank must be properly designed and  
11 constructed, and any part underground that routinely contains  
12 product must be protected from corrosion using one of the  
13 methods specified in items A to E. The corrosion protection  
14 methods in items A to D must be in accordance with one of the  
15 codes of practice in subpart 3 developed by a nationally  
16 recognized association or independent testing laboratory:

17 A. The tank is constructed of fiberglass-reinforced  
18 plastic.

19 B. The tank is constructed of steel and cathodically  
20 protected in the following manner:

21 (1) the tank is coated with a suitable dielectric  
22 material;

23 (2) field-installed cathodic protection systems  
24 are designed by a corrosion expert;

25 (3) impressed current systems are designed to  
26 allow determination of current operating status as required in  
27 part 7150.0210, subpart 4; and

28 (4) cathodic protection systems are operated and  
29 maintained according to part 7150.0210.

30 C. The tank is constructed of a steel- and  
31 fiberglass-reinforced plastic composite.

32 D. The tank is constructed of metal without  
33 additional corrosion protection measures provided that:

34 (1) the tank is installed at a site that is  
35 determined by a corrosion expert not to be corrosive enough to

1 cause it to have a release due to corrosion during its operating  
2 life; and

3 (2) owners and operators maintain records that  
4 demonstrate compliance with the requirements of subitem (1) for  
5 the remaining life of the tank.

6 E. The tank construction and corrosion protection are  
7 determined by the commissioner to be designed to prevent the  
8 release or threatened release of a stored regulated substance in  
9 a manner that is no less protective of human health and the  
10 environment than items A to D. The commissioner's determination  
11 under this item must be obtained in writing and owners and  
12 operators must keep the determination for the life of the tank.

13 Subp. 3. **Codes of practice for tanks.** Codes of practice  
14 for subpart 2 are described in items A to C.

15 A. The following codes of practice apply to subpart  
16 2, item A:

17 (1) Underwriters Laboratories UL 1316,  
18 Glass-Fiber-Reinforced Plastic Underground Storage Tanks for  
19 Petroleum Products;

20 (2) Underwriters Laboratories of Canada  
21 CAN4-S615-M83, Standard for Reinforced Plastic Underground Tanks  
22 for Petroleum Products; or

23 (3) American Society of Testing and Materials  
24 D4021-86, Standard Specification for Glass-Fiber-Reinforced  
25 Polyester Underground Petroleum Storage Tanks.

26 B. The following codes of practice apply to subpart  
27 2, item B:

28 (1) Steel Tank Institute Specifications for  
29 STI-P3 System of External Corrosion Protection of Underground  
30 Steel Storage Tanks;

31 (2) Underwriters Laboratories UL 1746, Corrosion  
32 Protection Systems for Underground Storage Tanks;

33 (3) Underwriters Laboratories of Canada  
34 CAN4-S603.1-M85, Standard for Galvanic Corrosion Protection  
35 Systems for Steel Underground Tanks for Flammable and  
36 Combustible Liquids;

1 (4) Underwriters Laboratories of Canada  
2 CAN4-S603-M85, Standard for Steel Underground Tanks for  
3 Flammable and Combustible Liquids;

4 (5) Underwriters Laboratories of Canada  
5 CAN4-S631-M84, Standard for Isolating Bushings for Steel  
6 Underground Tanks Protected with Coatings and Galvanic Systems;

7 (6) National Association of Corrosion Engineers  
8 RP-02-85, Control of External Corrosion on Metallic Buried,  
9 Partially Buried, or Submerged Liquid Storage Systems; or

10 (7) Underwriters Laboratories UL 58, Steel  
11 Underground Tanks for Flammable and Combustible Liquids.

12 C. The following codes of practice apply to subpart  
13 2, item C:

14 (1) Underwriters Laboratories UL 1746, Corrosion  
15 Protection Systems for Underground Storage Tanks;

16 (2) Association of Composite Tanks ACT-100,  
17 Specification for the Fabrication of FRP Clad Underground  
18 Storage Tanks; or

19 (3) Steel Tank Institute STI F894-89,  
20 Specification for External Corrosion Protection of FRP Composite  
21 Steel Underground Storage Tanks.

22 Subp. 4. **Piping.** The piping that routinely contains  
23 regulated substances and is in contact with the ground must be  
24 properly designed, constructed, and protected from corrosion  
25 using one of the methods specified in items A to D. The  
26 corrosion protection methods in items A to C must be in  
27 accordance with one of the codes of practice in subpart 5  
28 developed by a nationally recognized association or independent  
29 testing laboratory:

30 A. The piping is constructed of fiberglass-reinforced  
31 plastic.

32 B. The piping is constructed of steel and  
33 cathodically protected in the following manner:

34 (1) the piping is coated with a suitable  
35 dielectric material;

36 (2) field-installed cathodic protection systems

1 are designed by a corrosion expert;

2 (3) impressed current systems are designed to  
3 allow determination of current operating status as required in  
4 part 7150.0210, subpart 4; and

5 (4) cathodic protection systems are operated and  
6 maintained according to part 7150.0210.

7 C. The piping is constructed of metal without  
8 additional corrosion protection measures, provided that:

9 (1) the piping is installed at a site that is  
10 determined by a corrosion expert to not be corrosive enough to  
11 cause it to have a release due to corrosion during its operating  
12 life; and

13 (2) owners and operators maintain records that  
14 demonstrate compliance with subitem (1) for the remaining life  
15 of the piping.

16 D. The piping construction and corrosion protection  
17 are determined by the commissioner to be designed to prevent the  
18 release or threatened release of a stored regulated substance in  
19 a manner that is no less protective of human health and the  
20 environment than the requirements of items A to C. The  
21 commissioner's determination under this item must be obtained in  
22 writing and the tank owners and operators must keep the  
23 determination for the life of the tank.

24 Subp. 5. **Codes of practice for piping.** Codes of practice  
25 for subpart 4 are described in items A to C.

26 A. The following codes of practice apply to subpart  
27 4, item A:

28 (1) Underwriters Laboratories UL 567, Pipe  
29 Connectors for Flammable and Combustible Liquids and LP-Gas;

30 (2) Underwriters Laboratories of Canada  
31 CAN4-S633-M84, Flexible Underground Hose Connectors for  
32 Flammable and Combustible Liquids; or

33 (3) Underwriters Laboratories of Canada ULC  
34 Subject C107C-M1984, Guide for Glass Fibre Reinforced Plastic  
35 Pipe and Fittings for Flammable Liquids.

36 B. The following codes of practice apply to subpart

1 4, item B:

2 (1) National Fire Protection Association 30,  
3 Flammable and Combustible Liquids Code;

4 (2) American Petroleum Institute 1615,  
5 Installation of Underground Petroleum Storage Systems;

6 (3) American Petroleum Institute 1632, Cathodic  
7 Protection of Underground Petroleum Storage Tanks and Piping  
8 Systems; or

9 (4) National Association of Corrosion Engineers  
10 RP-01-69, Control of External Corrosion on Underground or  
11 Submerged Metallic Piping Systems.

12 C. The following codes of practice apply to subpart  
13 4, item C:

14 (1) National Fire Protection Association 30,  
15 Flammable and Combustible Liquids Code; or

16 (2) National Association of Corrosion Engineers  
17 RP-01-69, Control of External Corrosion on Underground or  
18 Submerged Metallic Piping Systems.

19 Subp. 6. **Spill and overfill prevention equipment.**

20 A. Except as provided in item B, to prevent spilling  
21 and overfilling associated with product transfer to the  
22 underground storage tank system, owners and operators must use  
23 the following spill and overfill prevention equipment:

24 (1) spill prevention equipment that will prevent  
25 release of product to the environment when the transfer hose is  
26 detached from the fill pipe, for example, a spill catchment  
27 basin; and

28 (2) overfill prevention equipment that will:

29 (a) automatically shut off flow into the  
30 tank when the tank is no more than 95 percent full; or

31 (b) alert the transfer operator when the  
32 tank is no more than 90 percent full by restricting the flow  
33 into the tank or triggering a high-level alarm.

34 B. Owners and operators are not required to use the  
35 spill and overfill prevention equipment specified in item A if:

36 (1) alternative equipment is used that is

1 determined by the commissioner to be no less protective of human  
2 health and the environment than the equipment specified in item  
3 A; or

4 (2) the underground storage tank system is filled  
5 by transfers of no more than 25 gallons at one time.

6 The commissioner's determination under subitem (1) must be  
7 obtained in writing and the tank owners and operators must keep  
8 the determination for the life of the tank.

9 Subp. 7. **Installation.** All tanks and piping must be  
10 properly installed according to the manufacturer's instructions  
11 and one of the following codes of practice developed by a  
12 nationally recognized association or independent testing  
13 laboratory:

14 A. American Petroleum Institute 1615, Installation of  
15 Underground Petroleum Storage Systems;

16 B. Petroleum Equipment Institute RP 100, Recommended  
17 Practices for Installation of Underground Liquid Storage  
18 Systems;

19 C. American National Standards Institute B31.3,  
20 Chemical Plant and Petroleum Refinery Piping; or

21 D. American National Standards Institute B31.4,  
22 Liquid Transportation Systems for Hydrocarbons, Liquid Petroleum  
23 Gas, Anhydrous Ammonia and Alcohols.

24 Subp. 8. **Certification of installation.** Owners and  
25 operators must demonstrate compliance with subpart 7 by  
26 certifying on the underground storage tank notification form  
27 required in part 7150.0120 that:

28 A. the installer is in compliance with certification  
29 requirements imposed by the agency under chapter 7105; and

30 B. all work listed in the manufacturer's installation  
31 checklists has been completed.

32 7150.0110 UPGRADING OF EXISTING UNDERGROUND STORAGE TANK SYSTEMS.

33 Subpart 1. **Alternatives allowed.** Not later than December  
34 22, 1998, all existing underground storage tank systems must  
35 comply with one of the following requirements:

1           A. new underground storage tank system performance  
2 standards under part 7150.0100;

3           B. the upgrading requirements in subparts 2 to 4; or

4           C. closure requirements under parts 7150.0400 to  
5 7150.0440, including applicable requirements for corrective  
6 action under Minnesota Statutes, section 115.061.

7           Subp. 2. **Tank upgrading requirements.** Steel tanks must be  
8 protected from corrosion using the corrosion protection methods  
9 in items A to C.

10           A. A tank may be upgraded by internal lining if:

11                   (1) the lining is installed according to the  
12 requirements of part 7150.0230; and

13                   (2) within ten years after lining, and every five  
14 years after that, the lined tank is internally inspected and  
15 found to be structurally sound with the lining still performing  
16 according to original design specifications.

17           B. A tank may be upgraded by cathodic protection if  
18 the cathodic protection system meets the requirements of part  
19 7150.0100, subpart 2, item B, subitems (2) to (4), and the  
20 integrity of the tank is ensured using one of the methods in  
21 subitems (1) to (4).

22                   (1) The tank is internally inspected and assessed  
23 to ensure that the tank is structurally sound and free of  
24 corrosion holes prior to installing the cathodic protection  
25 system.

26                   (2) The tank has been installed for less than ten  
27 years and is monitored monthly for releases according to part  
28 7150.0330, items E to I.

29                   (3) The tank has been installed for less than ten  
30 years and is assessed for corrosion holes by conducting two  
31 tightness tests that meet the requirements of part 7150.0330,  
32 item D. The first tightness test must be conducted before  
33 installing the cathodic protection system. The second tightness  
34 test must be conducted between three and six months following  
35 the first operation of the cathodic protection system.

36                   (4) The tank is assessed for corrosion holes by a

1 method that is determined by the commissioner to prevent  
2 releases in a manner that is no less protective of human health  
3 and the environment than subitems (1) to (3).

4 C. A tank may be upgraded by both internal lining and  
5 cathodic protection if:

6 (1) the lining is installed according to part  
7 7150.0230; and

8 (2) the cathodic protection system meets the  
9 requirements of part 7150.0100, subpart 2, item B, subitems (2)  
10 to (4).

11 D. The corrosion protection methods in items A to C  
12 must be in accordance with one or more of the following codes of  
13 practice developed by a nationally recognized association or  
14 independent testing laboratory:

15 (1) American Petroleum Institute 1631, Interior  
16 Lining of Underground Storage Tanks;

17 (2) National Leak Prevention Association 631,  
18 Spill Prevention, Minimum 10-Year Life Extension of Existing  
19 Steel Underground Tanks by Lining Without the Addition of  
20 Cathodic Protection;

21 (3) National Association of Corrosion Engineers  
22 RP-02-85, Control of External Corrosion on Metallic Buried,  
23 Partially Buried, or Submerged Liquid Storage Systems; or

24 (4) American Petroleum Institute 1632, Cathodic  
25 Protection of Underground Petroleum Storage Tanks and Piping  
26 Systems.

27 Subp. 3. **Piping upgrading requirements.** Metal piping that  
28 routinely contains regulated substances and is in contact with  
29 the ground must meet the requirements of part 7150.0100, subpart  
30 4, item B, subitems (2) to (4).

31 Subp. 4. **Spill and overflow prevention equipment.** To  
32 prevent spilling and overflowing associated with product  
33 transfer to the underground storage tank system, all existing  
34 underground storage tank systems must comply with new  
35 underground storage tank system spill and overflow prevention  
36 equipment requirements in part 7150.0100, subpart 6.

1 7150.0120 NOTIFICATION REQUIREMENTS.

2 Subpart 1. Notice of underground storage tank system  
3 installation. At least 30 days before beginning installation of  
4 an underground storage tank system under part 7150.0100, owners  
5 and operators must notify the commissioner of their intent to  
6 install the underground storage tank system.

7 Subp. 2. Notification of new tanks and changes in  
8 service. An owner who brings an underground storage tank system  
9 into use or makes a change in service to an existing tank system  
10 after June 1, 1986, must, within 30 days of bringing such tank  
11 into use or making a change in service, submit to the agency, in  
12 the form prescribed by the commissioner, a notice of the  
13 existence of such tank system or type of change in service,  
14 including the information required by Minnesota Statutes,  
15 section 116.48, subdivisions 1 and 3.

16 Subp. 3. Owner and operator tank system certification.  
17 Owners and operators of new underground storage tank systems  
18 must certify in the notification form compliance with the  
19 following requirements:

20 A. installation of tanks and piping under part  
21 7150.0100, subpart 8;

22 B. cathodic protection of steel tanks and piping  
23 under part 7150.0100, subparts 2 and 4;

24 C. financial responsibility under Code of Federal  
25 Regulations, title 40, part 280, subpart H; and

26 D. release detection under parts 7150.0310 and  
27 7150.0320.

28 Subp. 4. Installer tank system certification. Owners and  
29 operators of new underground storage tank systems must ensure  
30 that the installer certifies in the notification form that the  
31 methods used to install the tanks and piping comply with part  
32 7150.0100, subpart 7, and that the installer is in compliance  
33 with certification requirements imposed by chapter 7105.

34 Subp. 5. Repairer tank system certification. Owners and  
35 operators of underground storage tank systems must ensure that

1 the repairer certifies in the notification form that the methods  
2 used to repair the tanks and piping comply with parts 7150.0110  
3 and 7150.0230 and that the repairer is in compliance with  
4 certification requirements imposed by chapter 7105.

5 Subp. 6. **Tank seller notification.** A person who sells a  
6 tank intended to be used as an underground storage tank or  
7 property that the seller knows contains an underground storage  
8 tank must notify the purchaser of the tank in writing of the  
9 owner's notification obligations under subpart 1 and under  
10 Minnesota Statutes, section 116.48.

11 GENERAL OPERATING REQUIREMENTS

12 7150.0200 SPILL AND OVERFILL CONTROL.

13 Subpart 1. **Spill and overfill release prevention.** Owners  
14 and operators must ensure that releases due to spilling or  
15 overfilling do not occur. The owner or operator must ensure  
16 that the volume available in the tank is greater than the volume  
17 of product to be transferred to the tank before the transfer is  
18 made and that the transfer operation is monitored constantly to  
19 prevent overfilling and spilling. One of the following codes of  
20 practice developed by a nationally recognized association or  
21 independent testing laboratory must be used to comply with this  
22 subpart:

23 A. National Fire Protection Association 30, Flammable  
24 and Combustible Liquids Code;

25 B. National Fire Protection Association 385, Standard  
26 for Tank Vehicles for Flammable and Combustible Liquids; or

27 C. American Petroleum Institute 1621, Bulk Liquid  
28 Stock Control at Retail Outlets.

29 Subp. 2. **Reporting and cleanup.** The owner and operator  
30 must report, investigate, and cleanup any spills and overfills  
31 according to Minnesota Statutes, section 115.061.

32 7150.0210 OPERATION AND MAINTENANCE OF CORROSION PROTECTION.

33 Subpart 1. **Owner and operator compliance.** Owners and  
34 operators of underground storage tank systems with corrosion  
35 protection must comply with the requirements in subparts 2 to 5

1 to ensure that releases due to corrosion are prevented for as  
2 long as the underground storage tank system is used to store  
3 regulated substances, or is temporarily closed in accordance  
4 with part 7150.0400.

5       Subp. 2. **Corrosion protection system maintenance.** All  
6 corrosion protection systems must be operated and maintained to  
7 continuously provide corrosion protection to the metal  
8 components of the part of the tank and piping that routinely  
9 contains regulated substances and is in contact with the ground.

10       Subp. 3. **Cathodic protection system maintenance.** All  
11 underground storage tank systems equipped with cathodic  
12 protection systems must be inspected for proper operation by a  
13 qualified cathodic protection tester according to the following  
14 requirements:

15           A. all cathodic protection systems must be tested  
16 within six months of installation and at least every three years  
17 after that; and

18           B. the criteria that are used to determine that  
19 cathodic protection is adequate as required by this subpart must  
20 be according to the code of practice in National Association of  
21 Corrosion Engineers RP-02-85, Control of External Corrosion on  
22 Metallic Buried, Partially Buried, or Submerged Liquid Storage  
23 Systems.

24       Subp. 4. **Impressed current system maintenance.**  
25 Underground storage tank systems with impressed current cathodic  
26 protection systems must also be inspected every 60 days to  
27 ensure the equipment is running properly.

28       Subp. 5. **Recordkeeping.** For underground storage tank  
29 systems using cathodic protection, records of the operation of  
30 the cathodic protection must be maintained according to part  
31 7150.0240 to demonstrate compliance with the performance  
32 standards in this part. These records must provide:

33           A. the results of the last three inspections required  
34 in subpart 4; and

35           B. the results of testing from the last two  
36 inspections required in subpart 3.

## 1 7150.0220 COMPATIBILITY.

2 Owners and operators must use an underground storage tank  
3 system made of or lined with materials that are compatible with  
4 the substance stored in the underground storage tank system.

5 Owners and operators storing alcohol blends may use the  
6 following guidance to comply with the requirements of this part:

7 A. American Petroleum Institute 1626, Storing and  
8 Handling Ethanol and Gasoline-Ethanol Blends at Distribution  
9 Terminals and Service Stations; or

10 B. American Petroleum Institute 1627, Storing and  
11 Handling of Gasoline-Methanol/Cosolvent Blends at Distribution  
12 Terminals and Service Stations.

## 13 7150.0230 REPAIRS ALLOWED.

14 Owners and operators of underground storage tank systems  
15 must ensure that repairs will prevent releases due to structural  
16 failure or corrosion as long as the underground storage tank  
17 system is used to store regulated substances. The owner and  
18 operator of the tank shall ensure that the person performing the  
19 repairs has been certified under chapter 7105. The repairs must  
20 meet the requirements in items A to F:

21 A. Repairs to underground storage tank systems must  
22 be properly conducted according to one of the following codes of  
23 practice developed by a nationally recognized association or  
24 independent testing laboratory:

25 (1) National Fire Protection Association 30,  
26 Flammable and Combustible Liquids Code;

27 (2) American Petroleum Institute 2200, Repairing  
28 Crude Oil, Liquefied Petroleum Gas and Product Pipelines;

29 (3) American Petroleum Institute 1631, Interior  
30 Lining of Underground Storage Tanks; or

31 (4) National Leak Prevention Association 631,  
32 Spill Prevention, Minimum 10-Year Life Extension of Existing  
33 Steel Underground Tanks by Lining Without the Addition of  
34 Cathodic Protection.

35 B. Repairs to fiberglass-reinforced plastic tanks

1 must be made according to the codes of practice required in item  
2 A.

3 C. Metal pipe sections and fittings that have  
4 released product as a result of corrosion or other damage must  
5 be replaced. Fiberglass pipes and fittings must be repaired in  
6 accordance with the manufacturer's specifications.

7 D. Repaired tanks and piping must be tightness tested  
8 according to parts 7150.0330, item D; and 7150.0340, item B,  
9 within 30 days after the date of the completion of the repair  
10 except as provided in subitems (1) to (3):

11 (1) the repaired tank is internally inspected  
12 according to the codes of practice required in item A;

13 (2) the repaired part of the underground storage  
14 tank system is monitored monthly for releases according to a  
15 method specified in part 7150.0330, items E to I; or

16 (3) another test method is used that is  
17 determined by the commissioner to be no less protective of human  
18 health and the environment than the tests in subitems (1) and  
19 (2).

20 E. Within six months after the repair of a  
21 cathodically protected underground storage tank system, the  
22 cathodic protection system must be tested according to part  
23 7150.0210, subparts 3 and 4, to ensure that it is operating  
24 properly.

25 F. Owners and operators must maintain records of each  
26 repair, and of a commissioner's determination under item D,  
27 subitem (3), for the remaining operating life of the underground  
28 storage tank system that demonstrate compliance with the  
29 requirements of this part.

30 7150.0240 REPORTING AND RECORDKEEPING.

31 Owners and operators of underground storage tank systems  
32 must cooperate fully with inspections, monitoring, and testing  
33 conducted by the agency, as well as requests for document  
34 submission, testing, and monitoring by the owner or operator  
35 under United States Code, title 42, section 6991d.

1           A. Owners and operators must submit the following  
2 information to the commissioner:

3                   (1) notification of all underground storage tank  
4 systems under part 7150.0120, including certification of  
5 installation for new underground storage tank systems under part  
6 7150.0100, subpart 8;

7                   (2) notification of the discovery of an abandoned  
8 tank or of a change in the uses, contents, or ownership of a  
9 tank under Minnesota Statutes, section 116.48, subdivisions 2  
10 and 3;

11                   (3) reports of all releases under Minnesota  
12 Statutes, section 115.061, including suspected releases, spills  
13 and overfills, and confirmed releases;

14                   (4) information generated in the course of taking  
15 corrective action as defined in Minnesota Statutes, section  
16 115C.02, subdivision 4; and

17                   (5) a notification before permanent closure or  
18 change in service under part 7150.0410.

19           B. Owners and operators must maintain the following  
20 information:

21                   (1) a corrosion expert's analysis of site  
22 corrosion potential if corrosion protection equipment is not  
23 used under part 7150.0100, subparts 2, item D, and 4, item C;

24                   (2) the commissioner's determination that  
25 alternative corrosion protection or spill and overfill equipment  
26 means may be used under part 7150.0100, subpart 2, item E; 4,  
27 item D; or 6, item B;

28                   (3) documentation of operation of corrosion  
29 protection equipment under part 7150.0210, subpart 5;

30                   (4) documentation of underground storage tank  
31 system repairs under part 7150.0230, item F;

32                   (5) documentation of compliance with release  
33 detection requirements under part 7150.0350; and

34                   (6) results of the site investigation conducted  
35 at permanent closure under part 7150.0440.

36           C. Owners and operators must keep the records

1 required either:

2 (1) at the underground storage tank site where  
3 they are immediately available for inspection by the  
4 commissioner; or

5 (2) at a readily available alternative site where  
6 they can be provided for inspection to the commissioner upon  
7 request.

8 In the case of permanent closure records required under  
9 part 7150.0440, owners and operators are also provided with the  
10 additional alternative of mailing closure records to the  
11 commissioner if they cannot be kept at the site or an  
12 alternative site as required in this item.

13 RELEASE DETECTION

14 7150.0300 GENERAL REQUIREMENTS FOR ALL UNDERGROUND STORAGE TANK  
15 SYSTEMS.

16 Subpart 1. **Methods.** Owners and operators of new and  
17 existing underground storage tank systems must provide a method,  
18 or combination of methods, of release detection that:

19 A. can detect a release from any part of the tank and  
20 the connected underground piping that routinely contains  
21 product;

22 B. is installed, calibrated, operated, and maintained  
23 according to the manufacturer's instructions, including routine  
24 maintenance and service checks for operability or running  
25 condition; and

26 C. ~~meets the performance requirements in part~~  
27 ~~7150.0330 or 7150.0340, with any performance claims and their~~  
28 ~~manner of determination described in writing by the equipment~~  
29 ~~manufacturer or installer. In addition, all methods must be~~  
30 ~~capable of detecting the leak rate or quantity specified for~~  
31 ~~that method in part 7150.0330, items B to E, or 7150.0340, items~~  
32 ~~A and B, with a probability of detection of 0.95 and a~~  
33 ~~probability of false alarm of 0.05.~~ meets the performance  
34 standards in part 7150.0330 or 7150.0340. The performance of  
35 release detection equipment must be documented with written

1 specifications supplied by the equipment manufacturer or  
 2 installer. In addition, methods used after the date shown in  
 3 the following table, except for methods permanently installed  
 4 prior to that date, must be capable of detecting the leak rate  
 5 or quantity specified for that method in the part of the rules  
 6 listed in the table with a probability of detection of 0.95 and  
 7 a probability of false alarm of 0.05:

| 8  | <u>Method</u>          | <u>Part</u>            | <u>Date</u>        |
|----|------------------------|------------------------|--------------------|
| 10 | Manual tank gauging    | 7150.0330, items B & C | December 22, 1990  |
| 11 | Tank tightness testing | 7150.0330, item D      | December 22, 1990  |
| 12 | Automatic tank gauging | 7150.0330, item E      | December 22, 1990  |
| 13 | Automatic line leak    | 7150.0340, item A      | September 22, 1991 |
| 14 | detection              |                        |                    |
| 15 | Line tightness testing | 7150.0340, item B      | December 22, 1990  |

17 Subp. 2. **Release notification.** When a release detection  
 18 method operated according to the performance standards in parts  
 19 7150.0330 and 7150.0340 indicates a release may have occurred,  
 20 owners and operators must notify the agency according to  
 21 Minnesota Statutes, section 115.061.

22 Subp. 3. **Release detection schedule.** Owners and operators  
 23 of all underground storage tank systems must comply with the  
 24 release detection requirements of parts 7150.0300 to 7150.0350  
 25 by December 22 of the year listed in the following table.  
 26 Hazardous material tanks which are not regulated by Code of  
 27 Federal Regulations, title 40, part 280, must comply with these  
 28 requirements by the date indicated or by (insert date 180 days  
 29 after date of adoption), whichever is later:

30 Schedule for Phase-in of Release Detection

| 31 | Year System Was           | Year When Release Detection is Required (by |      |      |      |      |
|----|---------------------------|---|------|------|------|------|
| 32 | Installed                 | December 22 of the year indicated)          |      |      |      |      |
| 33 |                           | 1989  | 1990 | 1991 | 1992 | 1993 |
| 34 | Before 1965 or            | RD  | P    |      |      |      |
| 35 | date unknown              |   |      |      |      |      |
| 36 | 1965-1969                 |   | P/RD |      |      |      |
| 37 | 1970-1974                 |   | P    | RD   |      |      |
| 38 | 1975-1979                 |   | P    |      | RD   |      |
| 39 | 1980-1988                 |   | P    |      |      | RD   |
| 40 |                           |   |      |      |      |      |
| 41 |                           |   |      |      |      |      |
| 42 | New tanks                 | Immediately upon installation               |      |      |      |      |
| 43 | (after December 22, 1988) |   |      |      |      |      |

44  
 45 P=must begin release detection for all pressurized piping  
 46 according to part 7150.0310.

47 RD=must begin release detection for tanks and suction

1 piping according to parts 7150.0310, items A and B, subitem (2);  
2 and 7150.0320.

3 Subp. 4. Closure. Owners and operators of existing  
4 underground storage tank systems that cannot apply a method of  
5 release detection that complies with the requirements of parts  
6 7150.0300 to 7150.0350 must complete the closure procedures in  
7 parts 7150.0400 to 7150.0440 by the date on which release  
8 detection is required for the underground storage tank system  
9 under subpart 3.

10 7150.0310 REQUIREMENTS FOR PETROLEUM UNDERGROUND STORAGE TANK  
11 SYSTEMS.

12 Owners and operators of petroleum underground storage tank  
13 systems must provide release detection for tanks and piping as  
14 required in items A and B.

15 A. Tanks must be monitored at least every 30 days for  
16 releases using one of the methods in part 7150.0330, items E to  
17 I, except that:

18 (1) underground storage tank systems that meet  
19 the performance standards in part 7150.0100 or 7150.0110, and  
20 the monthly inventory control requirements in part 7150.0330,  
21 item A or B, may use tank tightness testing, conducted according  
22 to part 7150.0330, item D, at least every five years until  
23 December 22, 1998, or until ten years after the tank is  
24 installed or upgraded under part 7150.0110, item B, whichever is  
25 later;

26 (2) underground storage tank systems that do not  
27 meet the performance standards in part 7150.0100 or 7150.0110  
28 may use monthly inventory controls conducted according to part  
29 7150.0330, item A or B, and annual tank tightness testing  
30 conducted according to part 7150.0330, item D, until December  
31 22, 1998, when the tank must be upgraded under part 7150.0110 or  
32 permanently closed under part 7150.0410; and

33 (3) tanks with capacities of 550 1,000 gallons or  
34 less may use weekly manual tank gauging conducted according to  
35 part 7150.0330, item B, as the sole method of release detection.

1 B. Underground piping that routinely contains  
2 regulated substances must be monitored for releases in a manner  
3 that meets one of the requirements in subitem (1) or (2).

4 (1) Underground piping that conveys regulated  
5 substances under pressure must:

6 (a) be equipped with an automatic line leak  
7 detector conducted according to part 7150.0340, item A; and

8 (b) have an annual line tightness test  
9 conducted according to part 7150.0340, item B, or have monthly  
10 monitoring conducted according to part 7150.0340, item C.

11 (2) Underground piping that conveys regulated  
12 substances under suction must either have a line tightness test  
13 conducted at least every three years and according to part  
14 7150.0340, item B, or use a monthly monitoring method conducted  
15 according to part 7150.0340, item C. No release detection is  
16 required for suction piping that is designed and constructed to  
17 meet the following standards:

18 (a) the below-grade piping operates at less  
19 than atmospheric pressure;

20 (b) the below-grade piping is sloped so that  
21 the contents of the pipe will drain back into the storage tank  
22 if the suction is released;

23 (c) only one check valve is included in each  
24 suction line;

25 (d) the check valve is located directly  
26 below and as close as practical to the suction pump; and

27 (e) a method is provided that allows  
28 compliance with units (b) to (d) to be readily determined.

29 7150.0320 REQUIREMENTS FOR HAZARDOUS MATERIAL UNDERGROUND  
30 STORAGE TANK SYSTEMS.

31 Owners and operators of hazardous material underground  
32 storage tank systems must provide release detection that meets  
33 the requirements in items A and B.

34 A. Release detection at existing hazardous material  
35 underground storage tank systems must meet the requirements for

1 petroleum underground storage tank systems in part 7150.0310 by  
2 the dates set forth in part 7150.0300. By December 22, 1998,  
3 all existing hazardous material underground storage tank systems  
4 must meet the release detection requirements for new systems in  
5 item B.

6 B. Release detection at new hazardous material  
7 underground storage tank systems must meet the requirements in  
8 subitems (1) to (5):

9 (1) Secondary containment systems must be  
10 designed, constructed, and installed to:

11 (a) contain regulated substances released  
12 from the tank system until they are detected and removed;

13 (b) prevent the release of regulated  
14 substances to the environment at any time during the operational  
15 life of the underground storage tank system; and

16 (c) be checked for evidence of a release at  
17 least every 30 days.

18 The provisions of part 7045.0528 may be used to comply with  
19 this subitem.

20 (2) Double-walled tanks must be designed,  
21 constructed, and installed to:

22 (a) contain a release from any part of the  
23 inner tank within the outer wall; and

24 (b) detect the failure of the inner wall.

25 (3) External liners, including vaults, must be  
26 designed, constructed, and installed to:

27 (a) contain 100 percent of the capacity of  
28 the largest tank within its boundary;

29 (b) prevent the interference of  
30 precipitation or groundwater intrusion with the ability to  
31 contain or detect a release of regulated substances; and

32 (c) surround the tank completely, for  
33 example, it is capable of preventing lateral as well as vertical  
34 migration of regulated substances.

35 (4) Underground piping must be equipped with  
36 secondary containment that satisfies the requirements of subitem

1 (1), for example, trench liners and jacketing of double-walled  
2 pipe. In addition, underground piping that conveys regulated  
3 substances under pressure must be equipped with an automatic  
4 line leak detector according to part 7150.0340, item A.

5 (5) Other methods of release detection may be  
6 used if owners and operators:

7 (a) demonstrate to the commissioner that an  
8 alternate method can detect a release of the stored substance as  
9 effectively as any of the methods allowed in part 7150.0330,  
10 items B to I, can detect a release of petroleum;

11 (b) provide information to the commissioner  
12 on effective corrective action technologies, health risks, and  
13 chemical and physical properties of the stored substance, and  
14 the characteristics of the underground storage tank site; and

15 (c) obtain approval from the commissioner to  
16 use the alternate release detection method before the  
17 installation and operation of the new underground storage tank  
18 system.

19 7150.0330 METHODS OF RELEASE DETECTION FOR TANKS.

20 Each method of release detection for tanks used to meet the  
21 requirements of part 7150.0310 must be conducted according to  
22 items A to I.

23 A. Product inventory control or another test of  
24 equivalent performance must be conducted monthly to detect a  
25 release of at least 1.0 percent flow-through plus 130 gallons on  
26 a monthly basis in the following manner:

27 (1) inventory volume measurements for regulated  
28 substance inputs, withdrawals, and the amount still remaining in  
29 the tank are recorded each operating day;

30 (2) the equipment used is capable of measuring  
31 the level of product over the full range of the tank's height to  
32 the nearest one-eighth of an inch;

33 (3) the regulated substance inputs are reconciled  
34 with delivery receipts by measurement of the tank inventory  
35 volume before and after delivery;

1 (4) deliveries are made through a drop tube that  
2 extends to within one foot of the tank bottom;

3 (5) product dispensing is metered and recorded  
4 within the local standards for meter calibration incorporated by  
5 reference at part 7600.6800; and

6 (6) the measurement of any water level in the  
7 bottom of the tank is made to the nearest one-eighth of an inch  
8 at least once a month.

9 Practices described in American Petroleum Institute 1621,  
10 Recommended Practice for Bulk Liquid Stock Control at Retail  
11 Outlets, may be used, where applicable, as guidance in meeting  
12 the requirements of this item.

13 B. Manual tank gauging may be used as described in  
14 this item to meet the requirements of part 7150.0310, item A.

15 (1) For tanks with capacities of 1,000 gallons or  
16 less, weekly manual tank gauging may be used as the sole method  
17 of release detection.

18 (2) For tanks with capacities of 1,001 to 2,000  
19 gallons, manual tank gauging may be used in place of product  
20 inventory control in item A.

21 For tanks not described in subitems (1) and (2), manual  
22 tank gauging may not be used to satisfy the provisions of part  
23 7150.0310, item A.

24 C. Manual tank gauging must meet the following  
25 requirements:

26 (1) tank liquid level measurements are taken at  
27 the beginning and ending of a period of at least 36 hours during  
28 which no liquid is added to or removed from the tank;

29 (2) level measurements are based on an average of  
30 two consecutive stick readings at both the beginning and ending  
31 of the period; and

32 (3) the equipment used is capable of measuring  
33 the level of product over the full range of the tank's height to  
34 the nearest one-eighth of an inch.

35 A leak is suspected and subject to the requirements of  
36 Minnesota Statutes, section 115.061, if the variation between

1 beginning and ending measurements exceeds the weekly or monthly  
2 standards in the following table:

| 3  | Weekly  | Monthly    | Minimum    |
|----|---|------------|------------|
| 4  | Standard  | Standard   | Duration   |
| 5  | (one test) (four-test avg.)                                     |            | of Test    |
| 6  |   |            |            |
| 7  | If manual tank gauging is the ONLY leak detection method used:  |            |            |
| 8  |   |            |            |
| 9  | up to 550 gallons   | 10 gallons | 5 gallons  |
| 10 |   |            | 36 hours   |
| 11 | 551-1,000 gallons   | 9 gallons  | 4 gallons  |
| 12 | (when largest tank  |            | 44 hours   |
| 13 | is 64" x 73")   |            |            |
| 14 |   |            |            |
| 15 | 1,000 gallons   | 12 gallons | 6 gallons  |
| 16 | (if tank is   |            | 58 hours   |
| 17 | 48" x 128")   |            |            |
| 18 |   |            |            |
| 19 | If manual tank gauging is combined with Tank Tightness Testing: |            |            |
| 20 | 1,001-2,000   | 26 gallons | 13 gallons |
| 21 | gallons   |            | 36 hours   |
| 22 |   |            |            |

7 If manual tank gauging is the ONLY leak detection method used:

8  
9 up to 550 gallons 10 gallons 5 gallons 36 hours

10  
11 551-1,000 gallons 9 gallons 4 gallons 44 hours  
12 (when largest tank  
13 is 64" x 73")

14  
15 1,000 gallons 12 gallons 6 gallons 58 hours  
16 (if tank is  
17 48" x 128")

18  
19 If manual tank gauging is combined with Tank Tightness Testing:

20 1,001-2,000 26 gallons 13 gallons 36 hours  
21 gallons

22  
23 D. Tank tightness testing or another test of  
24 equivalent performance must be capable of detecting a 0.1 gallon  
25 per hour leak rate from any part of the tank that routinely  
26 contains product while accounting for the effects of thermal  
27 expansion or contraction of the product, vapor pockets, tank  
28 deformation, evaporation or condensation, and the location of  
29 the water table.

30 E. Equipment for automatic tank gauging that tests  
31 for the loss of product and conducts inventory control must meet  
32 the following requirements:

33 (1) the automatic product level monitor test can  
34 detect a 0.2 gallon per hour leak rate from any part of the tank  
35 that routinely contains product; and

36 (2) inventory control or another test of  
37 equivalent performance is conducted according to the  
38 requirements of item A.

39 F. Testing or monitoring for vapors within the soil  
40 gas of the excavation zone must meet the following requirements:

41 (1) the materials used as backfill are  
42 sufficiently porous such as gravel, sand, or crushed rock, to  
43 readily allow diffusion of vapors from releases into the  
44 excavation area;

45 (2) the stored regulated substance, or a tracer

1 compound placed in the tank system, is sufficiently volatile,  
2 such as gasoline, to result in a vapor level that is detectable  
3 by the monitoring devices located in the excavation zone in the  
4 event of a release from the tank;

5 (3) the measurement of vapors by the monitoring  
6 device is not rendered inoperative by the groundwater, rainfall,  
7 or soil moisture or other known interferences so that a release  
8 could go undetected for more than 30 days;

9 (4) the level of background contamination in the  
10 excavation zone will not interfere with the method used to  
11 detect releases from the tank;

12 (5) the vapor monitoring points are designed and  
13 operated to detect any significant increase in concentration  
14 above background of the regulated substance stored in the tank  
15 system, a component or components of that substance, or a tracer  
16 compound placed in the tank system;

17 (6) in the underground storage tank excavation  
18 zone, the site is assessed to ensure compliance with the  
19 requirements in subitems (1) to (4) and to establish the number  
20 and positioning of vapor monitoring points that will detect  
21 releases within the excavation zone from any part of the tank  
22 that routinely contains product; and

23 (7) vapor monitoring points are clearly marked  
24 and secured to avoid unauthorized access and tampering.

25 G. Testing or monitoring for liquids in the  
26 groundwater must meet the provisions of chapter 4725, must  
27 comply with local approvals or permits when located within a  
28 local public right-of-way, as well as meet the following  
29 requirements:

30 (1) the regulated substance stored is immiscible  
31 in water and has a specific gravity of less than one;

32 (2) groundwater is never more than 20 feet from  
33 the ground surface and the hydraulic conductivity of the soil  
34 between the underground storage tank system and the monitoring  
35 wells or devices is not less than 0.01 centimeters per second,  
36 for example, the soil should consist of gravels, coarse to

1 medium sands, coarse silts, or other permeable materials;

2 (3) the slotted part of the monitoring well  
3 casing must be designed to prevent migration of natural soils or  
4 filter pack into the well and to allow entry of regulated  
5 substance on the water table into the well under both high and  
6 low groundwater conditions;

7 (4) monitoring wells are sealed from the ground  
8 surface to the top of the filter pack;

9 (5) monitoring wells or devices intercept the  
10 excavation zone or are as close to it as is technically  
11 feasible;

12 (6) the continuous monitoring devices or manual  
13 methods used can detect the presence of at least one-eighth of  
14 an inch of free product on top of the groundwater in the  
15 monitoring wells;

16 (7) within and immediately below the underground  
17 storage tank system excavation zone, the site is assessed to  
18 ensure compliance with the requirements in subitems (1) to (5),  
19 and to establish the number and positioning of monitoring wells  
20 or devices that will detect releases from any part of the tank  
21 that routinely contains product; and

22 (8) monitoring wells are clearly marked and  
23 secured to avoid unauthorized access and tampering.

24 H. Interstitial monitoring between the underground  
25 storage tank system and a secondary barrier immediately around  
26 or beneath it may be used, but only if the system is designed,  
27 constructed, and installed to detect a leak from any part of the  
28 tank that routinely contains product and also meets one of the  
29 requirements of subitems (1) to (3).

30 (1) For double-walled underground storage tank  
31 systems, the sampling or testing method can detect a release  
32 through the inner wall in any part of the tank that routinely  
33 contains product. The provisions outlined in the Steel Tank  
34 Institute's Standard for Dual Wall Underground Storage Tanks may  
35 be used as guidance for aspects of the design and construction  
36 of underground steel double-walled tanks.

1                   (2) For underground storage tank systems with a  
2 secondary barrier within the excavation zone, the sampling or  
3 testing method used can detect a release between the underground  
4 storage tank system and the secondary barrier according to the  
5 following requirements:

6                   (a) the secondary barrier around or beneath  
7 the underground storage tank system consists of artificially  
8 constructed material that is sufficiently thick and impermeable,  
9 being at least  $10^{-6}$  centimeters per second for the regulated  
10 substance stored, to direct a release to the monitoring point  
11 and permit its detection;

12                   (b) the barrier is compatible with the  
13 regulated substance stored so that a release from the  
14 underground storage tank system will not cause a deterioration  
15 of the barrier allowing a release to pass through undetected;

16                   (c) for cathodically protected tanks, the  
17 secondary barrier must be installed so that it does not  
18 interfere with the proper operation of the cathodic protection  
19 system;

20                   (d) the groundwater, soil moisture, or  
21 rainfall will not render the testing or sampling method used  
22 inoperative so that a release could go undetected for more than  
23 30 days;

24                   (e) the site is assessed to ensure that the  
25 secondary barrier is always above the groundwater and not in a  
26 25-year flood plain, unless the barrier and monitoring designs  
27 are for use under such conditions; and

28                   (f) monitoring wells and vapor monitoring  
29 points are clearly marked and secured to avoid unauthorized  
30 access and tampering.

31                   (3) For tanks with an internally fitted liner, an  
32 automated device can detect a release between the inner wall of  
33 the tank and the liner, and the liner is compatible with the  
34 substance stored.

35                   I. Any other type of release detection method, or  
36 combination of methods, can be used if:

1 (1) it can detect a 0.2 gallon per hour leak rate  
2 or a release of 150 gallons within a month with a probability of  
3 detection of 0.95 and a probability of false alarm of 0.05; and  
4 (2) the owner and operator can demonstrate to the  
5 commissioner that the method can detect a release as effectively  
6 as any of the methods allowed in items D to H and obtain the  
7 commissioner's prior approval of the method. In comparing  
8 methods, the commissioner shall consider the size of release  
9 that the method can detect and the frequency and reliability  
10 with which it can be detected. If the method is approved by the  
11 commissioner, the owner and operator must comply with any  
12 conditions imposed by the commissioner on its use to ensure the  
13 protection of human health and the environment.

14 7150.0340 METHODS OF RELEASE DETECTION FOR PIPING.

15 Each method of release detection for piping used to meet  
16 the requirements of part 7150.0300 must be conducted according  
17 to items A to C.

18 A. Methods which alert the operator to the presence  
19 of a leak by restricting or shutting off the flow of regulated  
20 substances through piping or triggering an audible or visual  
21 alarm may be used only if they detect leaks of three gallons per  
22 hour at ten pounds per square inch line pressure within one  
23 hour. An annual test of the operation of the leak detector must  
24 be conducted according to the manufacturer's requirements.

25 B. A periodic test of piping may be conducted only if  
26 it can detect a 0.1 gallon per hour leak rate at one and  
27 one-half times the operating pressure.

28 C. Any of the methods in part 7150.0330, items F to  
29 I, may be used if they are designed to detect a release from any  
30 part of the underground piping that routinely contains regulated  
31 substances.

32 7150.0350 RELEASE DETECTION RECORDKEEPING.

33 Owners and operators shall maintain records according to  
34 part 7150.0240 demonstrating compliance with applicable  
35 requirements of parts 7150.0300 to 7150.0350. These records

1 must include the requirements of items A to C.

2           A. All written performance claims pertaining to any  
3 release detection system used, and the manner in which these  
4 claims have been justified or tested by the equipment  
5 manufacturer or installer, must be maintained for as long as the  
6 system is being used to comply with the requirements of this  
7 chapter.

8           B. The results of any sampling, testing, or  
9 monitoring must be maintained for at least ten years.

10           C. Written documentation of all calibration,  
11 maintenance, and repair of release detection equipment  
12 permanently located on-site must be maintained for at least ten  
13 years after the servicing work is completed. Any schedules of  
14 required calibration and maintenance provided by the release  
15 detection equipment manufacturer must be retained as long as the  
16 system is being used to comply with the requirements of this  
17 chapter.

18           D. Documentation of the commissioner's approval of  
19 alternate release detection methods under part 7150.0330, item  
20 I, must be maintained for as long as the methods are being used  
21 to comply with the requirements of this chapter.

22       OUT-OF-SERVICE UNDERGROUND STORAGE TANK SYSTEMS AND CLOSURE

23       7150.0400 TEMPORARY CLOSURE.

24           Subpart 1. **Requirements.** In addition to the requirements  
25 of chapter 7510, the Minnesota Uniform Fire Code, owners and  
26 operators must comply with the provisions in subparts 2 to 4  
27 relating to temporary closure.

28           Subp. 2. **Operation and maintenance during temporary**  
29 **closure.** When an underground storage tank system is temporarily  
30 closed, owners and operators must continue operation and  
31 maintenance of corrosion protection according to part 7150.0210,  
32 and any release detection according to parts 7150.0300 to  
33 7150.0350. Release detection is not required as long as the  
34 underground storage tank system is empty. The underground  
35 storage tank system is empty when all materials have been

1 removed using commonly employed practices so that no more than  
2 2.5 centimeters, or one inch, of residue, or 0.3 percent by  
3 weight of the total capacity of the underground storage tank  
4 system, remain in the system.

5 Subp. 3. **Tanks out of service 90 days.** When an  
6 underground storage tank system is temporarily closed for 90  
7 days or more, owners and operators must also comply with the  
8 following requirements:

9 A. leave vent lines open and functioning; and

10 B. cap and secure all other lines, pumps,  
11 passageways, and appurtenances.

12 Subp. 4. **Tanks out of service one year.** When an  
13 underground storage tank system is temporarily closed for more  
14 than 12 months, owners and operators must permanently close the  
15 underground storage tank system if it does not meet either  
16 performance standards in part 7150.0100 for new underground  
17 storage tank systems or the upgrading requirements in part  
18 7150.0110, except that the spill and overfill equipment  
19 requirements do not have to be met. Owners and operators must  
20 permanently close the substandard underground storage tank  
21 systems at the end of this 12-month period according to parts  
22 7150.0410 to 7150.0440, unless the commissioner provides an  
23 extension of the 12-month temporary closure period. Owners and  
24 operators must complete a site assessment according to part  
25 7150.0420 before such an extension can be applied for.

26 7150.0410 PERMANENT CLOSURE AND CHANGES-IN-SERVICE TO STORAGE OF  
27 NONREGULATED SUBSTANCES.

28 Subpart 1. **Requirements.** In addition to the requirements  
29 of chapter 7510, the Minnesota Uniform Fire Code, owners and  
30 operators must comply with the provisions in subparts 2 to 7  
31 relating to permanent closure and changes-in-service.

32 Subp. 2. **Notice of closure or change in service.** At least  
33 ten days before beginning either permanent closure or a  
34 change-in-service under subparts 3 and 4, owners and operators  
35 must notify the commissioner of their intent to permanently

1 close or make the change-in-service, unless such action is in  
2 response to corrective action. The required assessment of the  
3 excavation zone under part 7150.0420 must be performed after  
4 notifying the commissioner but before completion of the  
5 permanent closure or a change-in-service.

6 Subp. 3. **Permanent closure.** To permanently close a tank,  
7 owners and operators must empty and clean it by removing all  
8 liquids and accumulated sludges. All tanks taken out of service  
9 permanently must also be either removed from the ground or  
10 filled in with an inert solid material.

11 Subp. 4. **Storage of nonregulated substances.** Continued  
12 use of an underground storage tank system to store a  
13 nonregulated substance is considered a change in service.  
14 Before a change in service to storage of a nonregulated  
15 substance, owners and operators must empty and clean the tank by  
16 removing all liquid and accumulated sludge and conduct a site  
17 assessment according to part 7150.0420.

18 Subp. 5. **Certified removers.** Owners and operators must  
19 ensure that persons performing permanent closures under subpart  
20 3 or changes-in-service under subpart 4 are in compliance with  
21 certification requirements imposed by chapter 7105. Certified  
22 removers must furnish copies of current certificates issued by  
23 the agency to the owner and operator before beginning a  
24 permanent closure under subpart 3 or a change-in-service under  
25 subpart 4.

26 Subp. 6. **Tank system closure certification.** Owners and  
27 operators must ensure that the person who removes or otherwise  
28 closes an underground storage tank system certifies in the  
29 notification form that the methods used to remove or otherwise  
30 close the tanks and piping comply with part 7150.0410, subparts  
31 3 to 5.

32 Subp. 7. **Cleaning and closure procedures.** The cleaning  
33 and closure procedures listed in one of the following documents  
34 must be used as guidance for complying with this part:

35 A. American Petroleum Institute 1604, Removal and  
36 Disposal of Used Underground Petroleum Storage Tanks;

1 B. American Petroleum Institute 1631, Interior Lining  
2 of Underground Storage Tanks; or

3 C. American Petroleum Institute 2015, Cleaning  
4 Petroleum Storage Tanks.

5 7150.0420 ASSESSING THE SITE AT CLOSURE OR CHANGE IN SERVICE.

6 When removing or closing a tank or making a change in  
7 service to storage of a nonregulated substance, owners and  
8 operators must measure through laboratory analysis for the  
9 presence of a release where contamination is most likely to be  
10 present at the underground storage tank site. If contaminated  
11 soils, contaminated groundwater, or free product as a liquid or  
12 vapor is discovered by this measurement or by any other manner,  
13 owners and operators must notify the agency immediately and  
14 begin corrective action according to Minnesota Statutes, section  
15 115.061. In selecting sample types, sample locations, and  
16 measurement methods, owners and operators must consider the  
17 method of closure, the nature of the stored substance, the type  
18 of backfill, the depth to groundwater, and other factors  
19 appropriate for identifying the presence of a release. The  
20 requirements of this part are satisfied if one of the external  
21 release detection methods allowed in part 7150.0330, items F and  
22 G, is operating according to the requirements of part 7150.0330  
23 at the time of removal, closure, or making a change in service  
24 to storage of a nonregulated substance, and indicates no release  
25 has occurred.

26 7150.0430 APPLICABILITY TO PREVIOUSLY CLOSED UNDERGROUND STORAGE  
27 TANK SYSTEMS.

28 When directed by the commissioner, the owner and operator  
29 of an underground storage tank system permanently closed before  
30 December 22, 1988, must assess the excavation zone and close the  
31 underground storage tank system according to parts 7150.0400 to  
32 7150.0440 if releases from the underground storage tank may, in  
33 the judgment of the commissioner, pose a current or potential  
34 threat to human health and the environment.

## 1 7150.0440 CLOSURE RECORDS.

2 Owners and operators must maintain records according to  
3 part 7150.0240 that are capable of demonstrating compliance with  
4 closure requirements under parts 7150.0400 to 7150.0440. The  
5 results of the excavation zone assessment required in part  
6 7150.0420 must be maintained for at least three years after  
7 completion of permanent closure or change in service in one of  
8 the following ways:

9 A. by the owners and operators who took the  
10 underground storage tank system out of service;

11 B. by the current owners and operators of the  
12 underground storage tank system site; or

13 C. by mailing these records to the commissioner if  
14 they cannot be maintained at the closed facility.

## 15 7150.0500 INCORPORATION BY REFERENCE.

16 Subpart 1. **Scope.** For purposes of chapter 7150, the  
17 documents in subpart 2 are incorporated by reference. They can  
18 be found at the Minnesota State Law Library, Ford Building, 117  
19 University Avenue, Saint Paul, Minnesota 55155 or at the  
20 addresses indicated. If any of the documents are amended, and  
21 if the amendments are incorporated by reference or otherwise  
22 made a part of federal technical rules at Code of Federal  
23 Regulations, title 40, part 280, then the amendments to  
24 documents are also incorporated by reference in this chapter.

25 Subp. 2. **Referenced standards.** The documents incorporated  
26 by reference in this chapter are listed in items A to K:

27 A. American Societies of Mechanical Engineers, 345  
28 East 47th Street, New York, New York 10017.
