ADMINISTRATIVE
SERVICES

4 8100.0100 DEFINITIONS.

5 [For text of subs 1 to 3, see M.R.]

6 Subp. 3a. Beta. "Beta" is the measure of a stock's
7 volatility compared with a measurement of the overall market. A
8 beta of less than one indicates lower-than-market risk; a beta
9 of more than one indicates a higher-than-market risk. Beta is
10 part of the capital asset pricing model.

11 [For text of subs 4 and 5, see M.R.]

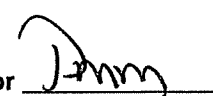

12 Subp. 5b. Contributions in aid of construction.

13 "Contributions in aid of construction" is money paid to another
14 utility, to be used directly or indirectly for the construction
15 or acquisition of plant; or the contribution of property that is
16 used as plant.

17 Subp. 5c. Cooperative association. "Cooperative
18 association" includes municipal power agencies and pipelines
19 that are not common carriers.

20 [For text of subs 6 to 10, see M.R.]

21 Subp. 11. Operating property. "Operating property" means
22 any tangible property that is owned or leased, except land,
23 which is directly associated with the generation, transmission,
24 or distribution of electricity, natural gas, gasoline, petroleum
25 products, or crude oil. Examples of operating property include,
26 but are not limited to, substations, transmission and
27 distribution lines, generating plants, and pipelines. Property

1 that is located on the same or contiguous parcels of land as
2 operating property is presumed to also be operating property.
3 Land is always nonoperating property.

4 Subp. 11a. **Original cost less depreciation.** "Original
5 cost less depreciation" means the original cost of the property
6 to the present owner, minus any depreciation attributable to the
7 property.

8 [For text of subps 12 and 13, see M.R.]

9 Subp. 13a. **Relative risk.** "Relative risk" means the risk
10 of a stock as measured by its beta.

11 Subp. 13b. **Risk-free rate.** "Risk-free rate" means the
12 theoretical rate of return on an absolutely riskless investment,
13 measured by long-term United States government securities.

14 Subp. 13c. **Risk premium.** "Risk premium" means the return
15 over and above the risk-free rate.

16 [For text of subps 14 and 15, see M.R.]

17 Subp. 16. **Unit value.** "Unit value" means the value of the
18 entire system plant of a utility company taken as a whole
19 without any regard to the value of its component parts.

20 8100.0200 INTRODUCTION.

21 The commissioner of revenue establishes an estimate of the
22 unit value for each utility company operating within the state.
23 The entire system is valued utilizing data relating to the cost
24 of the property, the earnings of the company owning or operating
25 the property, and additional indicators of value where
26 applicable. The resulting valuation is allocated to each state
27 in which the utility company operates. The value of property

1 located in Minnesota that is exempt from property tax or that is
2 locally assessed is subtracted from the value allocated to
3 Minnesota. Next, by the process of apportionment, the portion
4 allocated to Minnesota is distributed to the various taxing
5 districts within the state. The data used in the valuation,
6 allocation, and apportionment process is drawn from reports
7 submitted to the Department of Revenue by the utility
8 companies. These reports include Minnesota Department of
9 Revenue Annual Utility Reports (UTL forms), Reports to the
10 Minnesota Public Utilities Commission, Annual Reports to
11 Shareholders, Annual Reports to the Federal Energy Regulatory
12 Commission, United States Department of Agriculture, Rural
13 Utility Service or equivalent, and other publicly available
14 sources of information regarding rates. Periodic examinations
15 of the supporting data for these reports are made by the
16 Department of Revenue. Finally, the value is equalized based on
17 sales/assessment ratios determined by the Department of Revenue.

18 The commissioner of revenue reserves the right to exercise
19 discretion whenever the circumstances of a valuation estimate
20 dictate the need for it. Discretion may be used to ensure a
21 balance between a prescriptive rule and sound appraisal
22 judgment; to ensure that all relevant data pertaining to value
23 is considered; to ensure that a reasonable estimate of market
24 value is derived; to address concerns of predictability and
25 stability in estimations of market value; and to ensure that
26 utility valuation is easily understood and administered.

27 8100.0300 VALUATION.

1 Subpart 1. **General.** Because of the unique character of
2 public utility companies, the traditional approaches to
3 valuation estimates of property (cost, capitalized income, and
4 market) must be modified when utility property is valued.
5 Consequently, the value of utility company property is estimated
6 in the manner provided in this chapter.

7 All indicators of value must be considered to determine
8 their validity relating to the specific property being valued.
9 If an indicator is not demonstrated to be reliable or of value
10 for the specific property being appraised it must not be used.

11 Subp. 2. [See repealer.]

12 Subp. 3. **Cost approach.**

13 A. The cost factor to be considered in the utility
14 valuation formula is the original cost less depreciation of the
15 system plant, plus the cost of improvements to the system plant,
16 plus the original cost of all types of construction work in
17 progress that are installed by the assessment date, plus the
18 cost of property held for future use, plus the cost of
19 contributions in aid of construction. Original cost less
20 depreciation is presumed to be equal to historical cost less
21 depreciation. For rate-regulated companies, the commissioner
22 must use the same type of cost that is used in the rate base
23 calculation.

24 B. The original cost of any leased operating property
25 used by the utility must be reported to the commissioner in
26 conjunction with the annual utility report. If the original
27 cost of the leased operating property is not available, the

1 commissioner shall make an estimate of the cost by capitalizing
2 the lease payments.

3 C. If a conflict of opinion exists regarding the
4 character of specific property, whether it is operating or
5 nonoperating property, assessors or utility companies may
6 request a determination by the commissioner.

7 D. Depreciation is not allowed on construction work
8 in progress. Depreciation is allowed as a deduction from cost
9 in the amount allowed on the accounting records of the utility
10 company, as such records are required to be maintained by the
11 appropriate regulatory agency, except that depreciation may be
12 reduced if available information indicates the amount deducted
13 does not equal actual accrued depreciation when the current
14 estimated remaining life is considered.

15 E. The following example illustrates how the cost
16 indicator of value is computed for an electric company:

17	1. Utility Plant	\$200,000,000
18	2. Construction Work in Progress	\$ 5,500,000
19	3. Contributions in Aid of Construction	\$ 250,000
20	4. Leased Property	\$ 750,000
21	5. Total Plant	\$206,500,000
22	6. Book Depreciation	\$ 40,000,000
23	7. Depreciation on CIAC	\$ 10,000
24	8. Depreciation on Leased Property	\$ 25,000
25	9. Total Depreciation	\$ 40,035,000
26	10. Total Cost Indicator of Value	\$166,465,000

27
28 Subp. 4. **Income approach.** The income indicator of value
29 is estimated by weighting the capitalized net operating earnings
30 of the utility company for the most recent three years as
31 follows: most recent year, 40 percent; previous year, 35
32 percent; and final year, 25 percent. Utilities may request the
33 removal of nonrecurring items of income or expense. The

1 commissioner must determine if removal of the item is
 2 appropriate. The net income is capitalized by applying a
 3 capitalization rate that is computed by using the band of
 4 investment method. This method considers:

- 5 A. the capital structure of utilities;
- 6 B. the cost of debt or interest rate;
- 7 C. the yield on preferred stock of utilities;
- 8 D. the yield on common stock of utilities; and
- 9 E. the risk-free rate, relative risk, and risk
 10 premiums for public utility companies.

11 Capitalization rates are computed for electric companies,
 12 gas distribution companies, natural gas transmission systems,
 13 and fluid pipeline companies. The rates are recalculated each
 14 year using the method described in this subpart.

15 The following example illustrates how the income indicator
 16 of value would be computed for a gas distribution company:

	year 1	year 2	current year
17			
18			
19			
20	1. Net Operating Income \$ 394,000	\$ 450,000	\$ 470,000
21	2. Weighting Factor 25%	35%	40%
22	3. Weighted Income to		
23	be Capitalized 98,500	157,500	188,000
24	4. Capitalized Income		
25	at 9.25% 1,064,865	1,702,703	2,032,432
26	5. Total Income Indicator		
27	of Value		\$4,800,000
28			

29 Subp. 4a. Additional indicators of value. Additional
 30 indicators of value, other than the cost and income indicators,
 31 may exist in some situations. When additional indicators of
 32 value exist, the commissioner has the discretion to use these
 33 additional indicators in computing the unit value of a utility.

1 Additional indicators of value include, but are not limited to,
2 the market indicator.

3 A. If the commissioner determines that the market
4 indicator can be quantified, is reliable, and is indicative of
5 value for a company, the commissioner has the discretion to
6 adjust the weightings of the cost and income indicators to give
7 weight to the market indicator in the unit value computation.
8 If the market indicator is used, the weighting for the market
9 indicator must not exceed five percent.

10 B. If the commissioner finds that economic or other
11 forms of obsolescence exists, the commissioner has the
12 discretion to adjust the weightings in the correlation process
13 described in subpart 5 or make other adjustments in its
14 methodology consistent with these rules and applicable statutes.

15 C. If the commissioner uses additional indicators of
16 value, the commissioner must state in writing the findings that
17 necessitate deviation from the default weightings of 50 percent
18 for cost indicator and 50 percent for income indicator, as
19 described in subpart 5.

20 Subp. 5. Unit value computation. The unit value of the
21 utility company is equal to the total of the weighted indicators
22 of value. The total weighting must equal 100 percent. The
23 default weightings of the indicators are: market indicator, 0
24 percent; cost indicator, 50 percent; income indicator, 50
25 percent.

26 The following is an example of the computation of the unit
27 value for a utility company when the market indicator has been

1 determined to be a valid additional indicator of value:

- 2 1. Cost Indicator of Value:
3 \$5,000,000 x 47.5% = \$2,375,000
4 2. Income Indicator of Value:
5 \$4,800,000 x 47.5% = \$2,280,000
6 3. Market Indicator of Value:
7 \$5,500,000 x 5% = \$275,000
8 4. Unit Value of Utility Company:
9 Sum of indicators = \$4,930,000

10
11

Subp. 5a. Valuation election for cooperative

12 associations. After assessment year 2007, cooperative
13 associations have the option to irrevocably elect the method
14 under which they are valued.

15 A. For assessment year 2007, each cooperative must be
16 valued in the same manner as it was valued in assessment year
17 2006, using either the unit value method or cost less
18 depreciation method.

19 B. Beginning in assessment year 2008, cooperative
20 associations that were valued under the cost less depreciation
21 method in assessment year 2007 may irrevocably elect to be
22 valued using the unit value method described in subparts 1 to
23 5. Elections made by a cooperative association prior to
24 November 1 of any year are effective the next assessment year.
25 Such elections must be in a format prescribed by the
26 commissioner.

27 C. Prior to November 1 of assessment year 2008,
28 cooperative associations that were valued under the unit value
29 method in assessment year 2007 may irrevocably elect to be
30 valued under the cost less depreciation method. Such elections
31 will be in a format prescribed by the commissioner. Cooperative
32 associations that do not elect to revert back to valuation using

1 cost less depreciation method prior to November 1 of assessment
2 year 2008, are deemed to have irrevocably elected to be valued
3 using the unit value method.

4 Subp. 6. Cost less depreciation method of valuation for
5 utility property of cooperatives, municipal power agencies, and
6 pipelines that are not common carriers. Cooperative
7 associations may irrevocably elect to have their property valued
8 using the unit value method described in subparts 1 to 5.
9 Cooperative associations not electing unit valuation and other
10 types of utilities which do not operate in the traditional
11 profit-making mode, are not common carriers, or are
12 nonregulated, must have their utility property valued on the
13 basis of cost less depreciation. Elections made by a
14 cooperative association prior to November 1 of any year are
15 effective the next assessment year. Such elections must be in a
16 format prescribed by the commissioner.

17 A. Depreciation is allowed as a deduction from the
18 original cost in increments of 2-1/2 percent per year, but the
19 maximum depreciation allowed must not exceed 75 percent of the
20 cost of the utility operating property. Additions to existing
21 utility property are depreciated 2-1/2 percent per year until
22 they reach the 75 percent maximum. Retirements of utility
23 property are deducted from the cost basis at the average
24 depreciation level of all of the company's taxable property.

25 B. Cost less depreciation is calculated by using the
26 following inputs: the total cost at the end of the year
27 preceding the assessment year; total depreciation at the

1 beginning of the year preceding the assessment year; total cost
2 at the beginning of the year preceding the assessment year; and
3 the original cost of property retired during the year preceding
4 the assessment year.

5 Depreciation for the year is calculated by multiplying the
6 total cost at the end of the year preceding the assessment year
7 by 2-1/2 percent. Depreciation on retirements is calculated by
8 dividing the total depreciation for the year preceding the
9 assessment year by total cost at the beginning of the year
10 preceding the assessment year. This number is then multiplied
11 by the original cost of retirements for the year; the result is
12 equal to the depreciation on retirements for the year.

13 Net depreciation for the year is calculated by adding the
14 total depreciation at the beginning of the year preceding the
15 assessment year and the depreciation for the year, and then
16 subtracting the depreciation on retirements for the year. Net
17 depreciated value for the year is equal to the total cost at the
18 end of the year preceding the assessment year less net
19 depreciation for the year. Net depreciated value for the
20 assessment year is the total market value for all property owned
21 by the company.

22 A company factor is calculated by dividing the net
23 depreciated value for the assessment year by the total cost at
24 the end of the year preceding the assessment year. The factor
25 is multiplied by the cost of each individual parcel at the end
26 of the year preceding the assessment year to derive the market
27 value of each individual parcel.

1 C. The following example illustrates this process for
 2 an electric cooperative association electing cost less
 3 depreciation valuation under this subpart for assessment year
 4 2006.

5	Cost of individual parcels on	
6	12/31/2005 =	\$105,000
7		\$520,000
8		\$415,000
9		\$100,000
10	Total cost on 12/31/2005 of	
11	all property =	\$1,140,000
12	Total depreciation on 1/1/2005 =	\$300,000
13	Total cost on 1/1/2005 =	\$1,100,000
14	Original cost of retirements in 2006 =	\$6,000
15		
16	1. Depreciation for the assessment year 2006	
17	(\$1,140,000 x .025) =	\$28,500
18		
19	2. Depreciation on assessment year 2006 retirements	
20	(\$300,000 / \$1,100,000) x \$6,000 =	\$1,636
21		
22	3. Net depreciation for the assessment year 2006	
23	(\$300,000 + \$28,500 - \$1,636) =	\$326,864
24		
25	4. Depreciation Limit	
26	(\$1,140 <u>\$1,140,000</u> x .75) =	\$855,000
27		
28	5. Net depreciated value for the assessment year 2006	
29	(Total cost on 12/31/2005 -	
30	Lesser of Line 3 or Line 4)	
31	(\$1,140,000 - \$326,864) =	\$813,136
32	This is the market value for all property	
33	owned by the cooperative.	
34		
35	6. Company depreciation factor for 2006	
36	(\$813,136 / \$1,140,000) =	71.327751%
37		
38	7. Market value of each individual parcel	
39	(\$105,000 x 71.327751%) =	\$74,900
40	(\$520,000 x 71.327751%) =	\$370,900
41	(\$415,000 x 71.327751%) =	\$296,000
42	(\$100,000 x 71.327751%) =	\$71,300
43		

44 Subp. 8. Retirements. Utility operating property may be
 45 retired from the utility system while still in place if certain
 46 criteria are met:

47 A. The property must be physically disconnected from

1 the utility system. In the case of electrical plants, the
2 disconnection or dismantling of wires, cables, connectors, or
3 transformers constitutes physical disconnection. In the case of
4 pipelines, the disconnection of pipes, valves, or fittings is
5 evidence of physical disconnection.

6 B. An affidavit of retirement must be filed by the
7 utility with the commissioner at least 30 days prior to the
8 assessment date. This affidavit must indicate the facility
9 being retired and the date it was taken out of service.

10 C. The utility must make every effort to inform the
11 commissioner of pending major retirements. The commissioner in
12 turn shall notify the county assessor of impending major
13 retirements as soon as this information becomes available to the
14 department.

15 D. Utility real property which is retired in place
16 must continue to be taxed for ad valorem purposes. However, its
17 market value is not determined on the basis of its value as
18 utility operating property.

19 E. If a utility chooses to temporarily retire a
20 facility pending the development of an alternate fuel, greater
21 demand, increased source of supply, or another valid reason, the
22 cost of this facility must be transferred to the appropriate
23 regulatory agency's account entitled "Held for Future Use."
24 Standby facilities are not considered to be temporarily retired
25 unless their costs are carried in this account. Temporarily
26 retired utility facilities are valued taking into account a
27 number of factors including age of the facility, type of

1 facility, amount of maintenance and additional costs needed to
2 restore the facility to operational status, length of
3 retirement, and earning potential of the facility. A
4 temporarily retired facility must not be valued lower than if
5 the facility were considered nonoperating utility property.

6 8100.0400 ALLOCATION.

7 Subpart 1. **General.** After the unit value of the utility
8 property has been estimated, the portion of value which is
9 attributable to Minnesota must be determined. Each of the
10 factors in the allocation formula is assigned a weighted
11 percentage to denote the relative importance assigned to that
12 factor. The resulting sum of the weighted factors multiplied by
13 the unit value yields the valuation of the utility property
14 which is, after the adjustments described in part 8100.0500,
15 subject to ad valorem tax in the state of Minnesota.

16 [For text of subp 2, see M.R.]

17 Subp. 3. **Gas distribution companies.** The allocation of
18 value of gas distribution companies must be made considering the
19 same factors as are used to determine the allocation of value of
20 electric companies. The weight given to the original cost
21 factor is 75 percent, and gross revenue is weighted 25 percent.

22 Subp. 4. **Pipeline companies.** The allocation of pipeline
23 companies is equal to the original cost of the utility property
24 located in Minnesota divided by the total original cost of the
25 property in all states of operation weighted at 75 percent.
26 Additionally, throughput of product from operations in Minnesota
27 divided by throughput of product from operations in all states

1 is weighted at 25 percent.

2 The following example illustrates the allocation of value
3 of property of a pipeline company and the weights given to each
4 factor:

5	1. Minnesota Plant Cost	\$13,500,000		
6			x .75 =	25.76%
7	2. System Plant Cost	\$39,300,000		
8	3. Minnesota Throughput			
9	(Mcf or Barrel miles)	8,940,000	x .25 =	8.01%
10	4. System Throughput			
11	(Mcf or Barrel miles)	27,900,000		
12	5. Total Percentage Allocable			
13	to Minnesota			33.76%

14 8100.0500 ADJUSTMENTS FOR NON-FORMULA-ASSESSED OR EXEMPT
15 PROPERTY.

16 Subpart 1. Deduction for exempt or non-formula-assessed
17 property. After the Minnesota portion of the unit value of the
18 utility company, except for electric cooperatives, is
19 determined, any property which is non-formula-assessed or which
20 is exempt from ad valorem tax, is deducted from the Minnesota
21 portion of the unit value. Only that qualifying property
22 located within the state of Minnesota may be excluded.

23 Subp. 2. Valuation formula not applicable to certain
24 utility property. The following properties are valued by the
25 local or county assessor and, therefore, the formula provided
26 herein for the valuation of utility property is not applicable
27 to such property:

- 28 A. land;
- 29 B. nonoperating property; and
- 30 C. rights-of-way.

31 Subp. 3. Deduction for cost of land and rights-of-way;

1 application to nonoperating property. The Minnesota portion of
2 the unit value is reduced by the value included in the unit
3 value of the company for land, rights-of-way, nonoperating
4 property, and exempt property. This amount is calculated by
5 determining the ratio of the unit value computed in part
6 8100.0300, subpart 5, to the cost less depreciation allowed in
7 part 8100.0300, subpart 3. This ratio is multiplied by the cost
8 less depreciation of the property to be deducted.

9 Subp. 4. [See repealer.]

10 Subp. 4a. [See repealer.]

11 Subp. 5. **Burden of proof and responsibility of utility**
12 **company.** The utility company has the burden of proof to
13 establish that the value of any property should be excluded from
14 the Minnesota portion of the unit value. Accordingly, the
15 utility company has the responsibility to submit, in the form
16 required by the commissioner of revenue, such schedules of
17 exempt or non-formula-assessed property as the commissioner may
18 require.

19 8100.0800 PHASE-IN.

20 Subpart 1. **Phase-in of valuation changes.** Any change in
21 valuation is phased in over three years. For assessment years
22 2007, 2008, and 2009, each utility property must be valued both
23 under the valuation process of current Minnesota Rules, chapter
24 8100, ("current rules") and under the valuation process of
25 Minnesota Rules 2005, chapter 8100, as amended through March 2,
26 2000, ("old rules"). The difference, either positive or
27 negative, between the value derived under the current rules and

1 the value derived under old rules is incrementally added to the
2 value derived under the old rules as follows:

3 For assessment year 2007, 20 percent of the difference is
4 added to the value derived under the old rules; this amount is
5 the assessed value for 2007.

6 For assessment year 2008, 50 percent of the difference is
7 added to the value derived under the old rules; this amount is
8 the assessed value for 2008.

9 For assessment year 2009, and all subsequent assessment
10 years, the full value derived under the current rules is the
11 assessed value.

12 Subp. 2. Examples of phase-in valuations. The following
13 example illustrates a valuation when the value derived using the
14 old rules exceeds the value derived using the current rules:

15	1. Value for Assessment Year 2007	
16	Value under current rules	\$10,750,000
17	Value under old rules	\$12,000,000
18	Difference between old	
19	and current value	\$ 1,250,000
20	20% of difference	\$ 250,000
21	Assessed Value	\$11,750,000
22		
23	2. Value for Assessment year 2008	
24	Value under current rules	\$10,900,000
25	Value under old rules	\$12,750,000
26	Difference between old	
27	and current values	\$ 1,850,000
28	50% of difference	\$ 925,000
29	Assessed Value	\$11,825,000
30		
31	3. Value for Assessment Year 2009	
32	Value under current rules	\$11,750,000
33	Assessed Value	\$11,750,000
34		

35 The following example illustrates a valuation when the
36 value derived using the old rules is less than the value derived
37 using the current rules:

1	1. Value for Assessment Year 2007	
2	Value under current rules	\$15,000,000
3	Value under old rules	\$13,500,000
4	Difference between old	
5	and current values	\$ 1,500,000
6	20% of difference	\$ 300,000
7	Assessed Value	\$13,800,000
8		
9	2. Value for Assessment Year 2008	
10	Value under current rules	\$15,250,000
11	Value under old rules	\$14,250,000
12	Difference between old
